About Me

Lijie Yao 姚李捷 is a final-year Ph.D. candidate at the [AVIZ](#) team, [Inria](#) Saclay, and [University Paris-Saclay](#), supervised by [Dr. Petra Isenberg](#) and [Dr. Anastasia Bezerianos](#). Her Ph.D. thesis is on "[Situating Visualization in Motion](#)". Her work focused on exploring the impact of motion and spatial factors on visualizations' perception and how to design visualizations under motion in real application scenarios. She got her M.S. degree in [Computer Science](#) from [University Paris-Saclay](#) in 2020 and her M.Eng degree in [Electrical and Computer Engineering](#) from [Polytech Lille](#) in 2019. She received her B.Eng in [Electronic and Information Engineering](#) from [XIDIAN University](#) in 2018. She is now open to work.

Research Area

- Human-Computer Interaction: Focus on Visual Analytics & Information Visualization.
- Situated Visualization in Motion: Explore the impact of motion & spatial factors on visualizations' perception and how to best design and embed visualizations in motion in real application scenarios/in the physical world.
- Mobile & Wearable Devices: Mine users' real data needs in different using scenarios, particularly for health data and sports tracking, and develop prototypes to quickly design the visual representations and improve the perception efficiency of data displayed.

Education

09/2020 – 12/2023	Université Paris-Saclay Ph.D. - Computer Science <ul style="list-style-type: none">• Ph.D. Thesis: Situating visualization in motion• Supervisors: Dr. Petra Isenberg and Dr. Anastasia Bezerianos	Gif-sur-Yvette, France

Publication

- [Lijie Yao](#), Anastasia Bezerianos, Romain Vuillemot, Petra Isenberg. Visualization in Motion: A Research Agenda and Two Evaluations. *IEEE Transactions on Visualization and Computer Graphics (TVCG)*, 2022, 28(10), pp. 3546-3562, [\(10.1109/TVCG.2022.3184993\)](#), [\(hal-03698837\)](#).

Abstract:

We contribute a research agenda for visualization in motion and two experiments to understand how well viewers can read data from moving visualizations. We define visualizations in motion as visual data representations that are used in contexts that exhibit relative motion between a viewer and an entire visualization. Sports analytics, video games, wearable devices, or data physicalizations are example contexts that involve different types of relative motion between a viewer and a visualization. To analyze the opportunities and challenges for designing visualization in motion, we show example scenarios and outline a first research agenda. Motivated primarily by the prevalence of and opportunities for visualizations in sports and video games we started to investigate a small aspect of our research agenda: the impact of two important characteristics of motion—speed and trajectory on a stationary viewer’s ability to read data from moving donut and bar charts. We found that increasing speed and trajectory complexity did negatively affect the accuracy of reading values from the charts and that bar charts were

more negatively impacted. In practice, however, this impact was small: both charts were still read fairly accurately.

Envisioning Situated Visualizations of Environmental Footprints in an Urban Environment. *In Proceeding of IEEE VIS 2022 Workshop on Visualization for Social Good workshop (VIS4Good), October 2022, Oklahoma, United States.* [\(hal-03770857\)](#).

Abstract:

We present the results of a brainstorming exercise focused on how situated visualizations could be used to better understand the state of the environment and our personal behavioral impact on it. Specifically, we conducted a day long workshop in the French city of Bordeaux where we envisioned situated visualizations of urban environmental footprints. We explored the city and took photos and notes about possible situated visualizations of environmental footprints that could be embedded near places, people, or objects of interest. We found that our designs targeted four purposes and used four different methods that could be further explored to test situated visualizations for the protection of the environment.

Reflections on Visualization in Motion for Fitness Trackers. *In Proceeding of MobileHCI 2022 Workshop on New Trends in HCI and Sports (NTSPORT)*. September 2022, Vancouver, Canada. [\(hal-03775633\)](#)

Abstract:

In this paper, we reflect on our past work towards understanding how to design visualizations for fitness trackers that are used in motion. We have coined the term “visualization in motion” for visualizations that are used in the presence of relative motion between a viewer and the visualization. Here, we describe how visualization in motion is relevant to sports scenarios. We also provide new data on current smartwatch visualizations for sports and discuss future challenges for visualizations in motion for fitness trackers.

Abstract:

We contribute a systematic review of situated visualizations in motion in the context of video games. Video games produce rich dynamic datasets during gameplay that are often visualized to help players succeed in a game. Often these visualizations are moving either because they are attached to moving game elements or due to camera changes. We want to understand to what extent this motion and contextual game factors impact how players can read these visualizations. In order to ground our work, we surveyed 160 visualizations in motion and their embeddings in the game world. Here, we report on our analysis and categorization of these visualizations.

- [Lijie Yao](#), Anastasia Bezerianos, Romain Vuillemot, Petra Isenberg. Situated Visualization in Motion for Swimming. *Poster of the France National Conference on Visualization (Journée Visu), June 2022, Bordeaux, France.* [\(hal-03700406\)](#).

Abstract:

Competitive sports coverage increasingly includes information on athlete or team statistics and records. Sports video coverage has traditionally embedded representations of this data in fixed locations on the screen, but more recently also attached representations to athletes or other targets in motion. These publicly used representations so far have been rather simple and systematic investigations of the research

space of embedded visualizations in motion are still missing. Here we report on our preliminary research in the domain of professional and amateur swimming. We analyzed how visualizations are currently added to the coverage of Olympics swimming competitions and then plan to derive a design space for embedded data representations for swimming competitions. We are currently conducting a crowdsourced survey to explore which kind of swimming-related data general audiences are interested in, in order to identify opportunities for additional visualizations to be added to swimming competition coverage.

Abstract:

We contribute an analysis of situated visualizations in motion in video games for different types of data, with a focus on quantitative and categorical data representations. Video games convey a lot of data to players, to help them succeed in the game. These visualizations frequently move across the screen due to camera changes or because the game elements themselves move. Our ultimate goal is to understand how motion factors affect visualization readability in video games and subsequently the players' performance in the game. We started our work by surveying the characteristics of how motion currently influences which kind of data representations in video games. We conducted a systematic review of 160 visualizations in motion in video games and extracted patterns and considerations regarding what, and how visualizations currently exhibit motion factors in video games.

- [Lijie Yao](#), Anastasia Bezerianos, and Petra Isenberg. Situated Visualization in Motion. *Posters of the IEEE Conference on Visualization (InfoVis), October 2020, Salt Lake City, United States.* ([hal-02946587v2](#)).

Abstract:

We contribute a first design space on visualizations in motion and the design of a pilot study we plan to run in the fall. Visualizations can be useful in contexts where either the observation is in motion or the whole visualization is moving at various speeds. Imagine, for example, displays attached to an athlete or animal that show data about the wearer – for example, captured from a fitness tracking band; or a visualization attached to a moving object such as a vehicle or a soccer ball. The ultimate goal of our research is to inform the design of visualizations under motion.

THE FOLLOWING CONTENT IS FROM MY BACHELOR'S AND MASTERS' PERIODS.

On-campus Project Experience

- | | | |
|-------------------|--|------------------------|
| 12/2019 – 02/2020 | AR Game Development base on Unity
Project type: Personal project
Introduction: This was a course project, based on Unity, implemented by C#, through Vuforia library to develop an AR game applied for mobile devices. | Gif-sur-Yvette, France |
| 02/2019 – 10/2020 | Posture Interaction base on AlphaPose
Project type: Work by Two
Introduction: This course project was based on an open-source object detection library -- AlphaPose. The back end was implemented by Python, while the front end was realized by web techniques, including H5/JS/CSS/Ajax/Django. We provide the possibilities to interact with webpages by different postures in real-time. For instance, scroll a page up and down by nodding, zoom a figure in and out by stretching your thumb and index, swipe a page left and right by turning your body, and go to the next page by waving your hands.
My work: I implemented the back end, front end and the server. | Gif-sur-Yvette, France |
| 02/2019 – 10/2020 | Drone Control based on ROS
Project type: Work by Two
Introduction: This graduation-level project is based on ROS Kinetic, a specific robot operating system. We used the drone's camera and sensors to capture videos and images. We conducted image processing to detect the target object. We realized the smooth flying/pausing of the drone when tracking an object by automated closed-loop feedback.
My work: I established the working space of ROS, configured the camera and sensors and the communication between them, processed images based on standard computer vision, and implemented the user interface. | Lille, France |
| 02/2018 – 04/2018 | Real-time heart rate monitoring based on ATmega328p and TCL5947
Project type: Work by Two
Introduction: This graduation-level project was based on a temperature sensor, a heart rate sensor, a self-design and self-soldered PCB, and individual LED lights. We realized an electrical necklace with functionality to monitor the wearer's heart rate and temperature | Lille, France |

variance. When the wearer's heart rate and/or temperature was out of the normal range, the LED lights on the necklace would switch their colors to alarm.

My work: I designed and soldered the PCB, configured the communications between interfaces, and programmed the main functionality.

11/2015 – 10/2017 **A Virtual Machine Service based on Cloud Computing** Xian, China

Project type: Teamwork – 5 team members

Introduction: We realized a campus-based cloud computing platform. Our platform provided virtual machine service to students and faculty members through online access. Our platform provided the accessibility to a virtual machine 24/24 hours and 7/7 days from different client devices (both PC and mobile ends) and through different operating systems (windows, Linux, Android, and iOS). Our platform also provided storage and computing functions.

My work: I was the project leader. I established a private cloud based on ZStack and implemented the front-end interface.

Award: This work was awarded to the Excellent Project in Innovation and Entrepreneurship Training Program of Shaanxi Province (陕西省大学生创新创业训练计划项目省级优秀).

09/2015 – 10/2015 **Tangible Interaction based on Arduino** Xian, China

Project type: Teamwork – 3 team members

Introduction: We proposed interactions with computers through fruits. We connected fruits with computers with Arduino and cables. We modified the software-based music's tone and melody by different touch forces and touch positions on fruits.

My work: I was the project leader. I took care of the configuration of communication between interfaces.

Award: This work was awarded to the Second Award of the 27th XingHuoBei (星火杯) of XIDIAN University.

Awards

- 2018.06 荣获西安电子科技大学校级“优秀毕业生”
- 2017.12 获得西安电子科技大学“励志奖”奖学金
- 2017.12 获得西安电子科技大学“勤奋奖”奖学金
- 2015.06 - 2017.11 连续三年获得西安电子科技大学校级“优秀学生干部”
- 2017.07 《基于云计算的网页虚拟机服务》获得陕西省大学生创新创业训练计划项目 省级优秀
- 2016.06 获得西安电子科技大学校级二等奖学金
- 2015.07 获得西安电子科技大学“华山优秀学生干部”
- 2015.07 获得西安电子科技大学“华山道德模范”
- 2015.07 获得西安电子科技大学“华山活力之星”
- 2015.12 《基于 Arduino 的触摸控制》获得西安电子科技大学第二十七届星火杯校级二 等奖
- 2015.06 获得西安电子科技大学校级三等奖学金
- 2015.05 获得西安电子科技大学第二届国际文化节“优秀志愿者”
- 2014.12 获得西安电子科技大学第 59 期大学生业余党校高级班“优秀学员”荣誉称号
- 2014.08 获得西安电子科技大学军训旅“优秀学生”
